WESTERN ARCTIC ECONOMIC EVALUATION ECONOMIC IMPACT EVALUATION (1989-1998)

1. CONTEXT AND CONDITIONS

In order to determine the economic impact of Western Arctic Tourism Strategy it is essential to clearly identify the various components in which economic impacts can be quantified. Although the Western Arctic Region covers a large territory, in terms of its economic composition, it represents a very isolated economy with very little leakage from other sectors. The smaller and less diversified the area, the greater the leakage from the economy. Also because of the relatively few alternative economic opportunities, tourism has become an important sector of growth over the last few years. Its growth in the past five years is mainly attributable to Travel Arctic/TIA-NWT marketing as well as WAVA development and promotion activities.

According to the NWT Data 1986-1987, some "70 hotels, 60 lodges, and 75 outfitters operate within NWT". The same source also indicates that "approximately 15,654 people visited the NWT during the summer of 1984 and spent some \$10,650,000.00 in the NWT". It is esimated that the distribution of expenditures, by area, was as follows:

52% in Fort Simpson Region (including Yellowknife)
26% in the Inuvik Region
16% in the Baffin Region
5% in Central Arctic
1% in the Keewatin Region

If we hold the above distribution constant and apply it to absolute dollars spent, we will see that some \$2.7 M would have been spent in the Inuvik Region in 1984. The focus of the economic impact evaluation will be to determine the impacts of proposed tourism capital expenditures on the local economy in terms of both capital expansion programs and from a point of view of "multiplier" impacts of such spending.

Regional capital expenditures have been considered over a 1989-1998 time Although a number of costs which would normally represent frame. operating expenses are highlighted in the development costs (i.e. start up costs for campground, etc.) it was assumed that all costs were Further retained on a generic basis and treated as capital costs. analysis of cost structure could be provided if particular areas of the various construction periods, expenditure highlighted capi tal construction costs and the impact of capital renewals which may be necessary on an on going basis due to seasonality. All the capital expenditures proposed have been highlighted on the tables, by area, and by market segment.

3. MULTIPLIER IMPACTS

4

Multiplier impacts of both the tourist expenditures and capital spending was computed via the application of income and employment multipliers. A number of areas with similar economies were considered to determine Particular attention was paid to the the multiplier coefficients. economic structure of South Moresby Island for which similar studies previously completed and concrete input-output models were were A thorough analysis of the Western Arctic however, in constructed. terms of construction of an accurate economic input and output will be ltis needed for a more concise measurement of multiplier impacts. recommended that such a model be established for the region in order to have a precise evaluation of the impact of tourism on the individual Application of the Moresby model resulted in sectors of the economy. the following multiplier coefficients being used for this study.

Income Multipliers: Direct .2 Indirect .043 Induced .125 Employment Multipliers: Direct .02 Indirect .006 Induced .019 The multiplier effects from 1987 to 1998 (see Table 8) have been calculated to be as follows:

In 1987, in terms of direct, indirect, induced, the total income impact is estimated to be \$4.79 M. By 1998 the same impact is expected to rise to \$27.588 M, resulting in a \$22.8 M increase over an eleven year time frame.

4. MODEL APPLICATION

The base year is 1989 as it represents the opening per" od of capital injections.

Briefly, the application of the input-output model of South Moresby Island involved the determination of the following factors:

- o the total dollar revenues generated, both directly and indirectly, through activities and various capital programs proposed;
- o the total dollar value of payrolls, measured in FTE's (full time equivalent jobs) and seasonal help;
- o the total indirect payroll generated through secondary sources; and
- o total tax implications were also considered along with the incremental impact of added incomes to the region.

A cost benefit analysis type of model was employed by application of NPV (Net Present Value) factors so that the feasibility of capital expenditures via total tourist revenue generation could be matched within the defined time frames. NPV has been defined as discounted value of future dollars into todays dollars. Gross tourist expenditures were also matched with the net present values of capital expenditures in order to determine the cost benefit ratios. A further "incremental" revenue analysis was conducted via utilization of 1989 as the base year, upon which incremental benefits would accrue. Net present values of capital expenditures of capital expenditures in order to determine the cost benefit successful to the present values of severe analysis was conducted via utilization of 1989 as the base year, upon which incremental benefits would accrue. Net present values of capital expenditures in order to determine more realistic payout ratios. Briefly the following key information needs to be considered.

At approximately 10% NPW incremental expected revenues will provide a net value of \$35 M from 1989-1998. Within this period, total capital expenditures to be injected into the local economies, again at 10% NPV, would equate to \$15.7 M, indicating that from a cost benefit point of view the project is fully justified. Furthermore, in any capital expenditure situation the residual impacts of expenditures are normally felt over an extended period of time, benefiting the local areas far beyond the "defined" payout/analysis period. The attraction of the Western Arctic which has already been drawing high numbers of tourists will continue to improve as more services and attractions such as scheduled boat cruises, wildlife photography tours etc. become more available.

5. **EMPLOYMENT**

In terms of employment, although most of the positions created will be seasonal employment, the full impact of employment is expected to be some 70 FTE's (full time equivalents) which is expected to generate approximately \$1.3 M of payroll.

6. **INCOME**

Using very conservative multiplier coefficients, the direct, indirect and induced impact of tourist spending in the area is expected to be \$27.8 M in year 1998. For 1987 this impact has been computed at \$4.8 M.

7. **TAXES**

Overall income impact of proposed capital expenditures, both in terms of wages earned and goods purchased, from 1989 to 1998 is expected to be approximately \$180 M, resulting in \$23 M federal sales tax, \$27.5 M federal and provincial (i.e. Alberta, B.C.) income taxes.

When the various revenue, employment and tax impacts have been matched with the overall attraction of the area for long term tourism development, the proposed capital expenditures within the defined payout periods of 1989-1998 is more than fully justified.

8. FINANCIAL AND ECONOMIC ANALYSIS

Tables 1, 2 and 3 provide an overview of the estimated market projections, broken down by the market segment and the year. Average length of stay as well as average per diem dollar expenditure are also highlighted.

Table 4 provides average length of stay in certain market segments, by number of total days. The basis of determining these projections is the Dempster Highway Survey of 1987 as well as data obtained from a document produced by Canadian Facts, in December 1984, titled "Visitors to the Northwest Territories".

Table 5 provides an overview of the proposed capital expenditures by year and community. As shown on the table, most of the expenditures are proposed to be incurred from 1989 to 1992, gradually decreasing from 1992 to 1998. Total expenditure proposed is \$21.098 M. When this dollar amount is expressed in terms of net present values, say at 8%, the realistic value of total expenditure becomes \$16.613 M. Or, restated at various interest factors, values computed are as follows:

Net present value @ 9% - \$16.158 M Net present value @ 10% - \$15.723 M Net present value @ 12% - \$14.905 M Net present value @ 14% - \$14.152 M Net present value @ 15% - \$13.797 M

As will be seen with the above numbers, the proposed capital expenditures numbers become a lot more meaningful when restated.

In order to properly match the capital expenditures with benefits, they will accrue both the multiplier income values and the incremental impacts of tourist spendings have been expressed in terms of net present values.

Total tourist expenditures in terms of total dollars spent by market segment have been computed and are shown on Table 10. This particular table derives its base numbers from the projected market segments, average length of stay, and average spending patterns in various segments. Briefly the impact of such expenditures can be highlighted as follows:

YEAR	TOTAL TOURIST EXPENDITURES
1987	\$13.016 M
1988	\$16.403 M
1989	\$20.592 M
1990	\$26.032 M
1991	\$31.966 M
1992	\$39.064 M
1993	\$44.600 M
1994	\$49.299 M
1995	\$54.585 M
1996	\$60.565 M
1997	\$67.346 M Consolidated
1008	\$74 966 M
Total 1987-1998	\$498 434 M
10(21 1707-1770	Approximately 500 M

If we consolidate total projected tourist expenditures from 1987 to 1998 and express this consolidated number in terms of net present values, the impact can be summarized as follows:

Net present value @ 8% \$289.881 MNet present value @ 9% \$274.474 MNet present value @ 10% \$260.183 MNet present value @ 12% \$234.577 MNet present value @ 14% \$212.401 MNet present value @ 15% \$202.425 M Even with the highest interest factor, say at 15%, the total benefits that tourism dollars will bring into the area represent dollars which are approximately ten times higher than the **total** value of proposed capital expenditures. The question than becomes why spend some \$21.098 M in capital expenditures if the momentum of tourism spending continues and grows at approximately the same speed that has been happening over the last few years. The answer is very simple. Such capital expenditures will in fact safeguard and continue the flow of visitors into the region by simply providing better and improved options for the tourist and enhance the quality of such offerings.

Attractions such as organized boat cruises, **wildlife** photography, wilderness experience camps, etc. will continue to generate additional tourist spending and with each new capital expenditure will come increased revenues to the region.

Table 8 highlights the impact of such expenditures. Briefly, commencing in 1989 consolidated direct, indirect and induced impacts can be expected to generate some \$7.588 M of total income for the region. By 1998 this impact can be expected to rise to \$27.588 M. Within a nine year time frame, this increase of some \$20.00 M can be considered a major economic achievement. In terms of tax implications which is summarized on Table 14, in 1987, Federal income taxes are estimated to be \$1.447 M. By 1998 this number has been projected to increase to \$8.336 M, seventeen times higher. Tax implications as highlighted on Table 14, have been further broken down on Tables 12 and 13. These two tables indicate the sources of taxation and the basis of their computation.

Becase of the "lag" effect of capital expenditures and because of the attempt to match the proper payouts of the proposal, an "incremental revenue analysis" has been adopted as shown on. Table 15. This particular table simply uses 1988 as the "base" year to derive the benefits from the recognized "fallout" impact of capital expenditures from year to year as the proposed spending is spread over from 1989 to 1998.

Because it is not a "one shot" expenditure, proper analysis for the project and the benefits it will accrue has to be computed on an incremental basis. Expected incremental revenues from 1989 to 1998 have been summed up at \$51.781 M. When we also revalue these benefits, in terms of present values the following results as shown on Table 9 become very meaningful.

INTEREST 2	NPY OF Capital spending	NPY OF INCREMENTAL REVENUES
8%	\$16.614 M	\$38.436 M
9%	\$16.159 M	\$36.666 M
10%	\$15.723 M	\$35.016 M
12%	\$14.904 M	\$32.038 M
14%	\$14.151 M	\$29.433 M
15%	\$13.797 M	\$28.253 M

Even under the highest interest rate factors i.e. a 15% NPV payout ratio that is, total proposed expenditures vs total benefits they will accrue, is 3.6 times better. Expressed in a different way, the project will pay itself off 3.6 times within the given time frames. It is also important to recognize that any benefits to accrue from undertaking a capital project will continue far beyond the normal payout period well into the future as the useful lives of the assets created" or acquired are a lot longer than the defined payout period of a project. Accordingly, the payout ratio computed above can be expected to be rough higher if we consider time frames beyond 1998.

In light of the above analysis and in recognization of the importance of tourism in the Western Arctic, the implementation of the proposed capital expenditures is fully justified.

9. DEFINITIONS

Direct Impacts

The initial injection of tourist spending is called the direct expenditures. This particular expenditure creates a direct revenue source to hotels, motels, lodges and campgrounds.

Indirect Impacts

The indirect component refers to those types of businesses whose turnover will be augmented by the portion of initial expenditure that remains within the region as factor incomes such as wages, rents and salaries.

Induced Impacts

The induced effect normally constitutes a general increase in the overall economic activity due to increase household consumption as the incremental wages injected into the **local** economy provide additional consumption power.

10. COST AND BENEFIT ANALYSIS

By utilizing the "cost and benefit" method as well as the "incremental approach as the relevant capital costs and the matching revenue" revenues to be generated via tourist spending and multiplier impacts Given the scope of capital injections and the peculiar were computed. tourist attractions of the region, it would be feasible to consider the project particularly in light of its economic impacts which is essential "wealth generation" point of view. from a regional lt is also interesting to note that such expenditures will be seasonal and cyclical in that weather conditions will necessitate some degree of assurance that increased tourism activity in the area will undoubtedly increase thus resulting in added capital formations and injections.
